

Ex. No:10

Date:

E-B OOK MANAGEMENT SYSTEM

AIM:

To create a system to perform E- book Management System.

PROBLEM STATEMENT:

An E- Book lends books and magazines to member, who is registered in the system. Also it handles the purchase of new titles for the Book Bank. Popular titles are brought into multiple copies. Old books and magazines are removed when they are out of date or poor in condition. A member can reserve a book or magazine that is not currently available in the book bank, so that when it is returned or purchased by the book bank, that person is notified. The book bank can easily create, replace and delete information about the titles, members, loans and reservations from the system.

SOFTWARE RESOURCE SPECIFICATION:

2.0 OVERALL DESCRIPTION

It will describe major role of the system components and inter-connections.

2.1 PRODUCT PERSPECTIVE

The ORS acts as an interface between the user and the 'e-book manager'. This system tries to make the interface as simple as possible and at the same time not risking the security of data stored in. This minimizes the time duration in which the user receives the books or magazines.

2.2 SOFTWARE INTERFACE

Front End Client - The Student and Librarian online interface is built using JSP and HTML. The Librarians local interface is built using Java.

Web Server - Glassfish application server (Oracle Corporation).

Back End - Oracle database

HARDWARE INTERFACE

The server is directly connected to the client systems. The client systems have access to database in the server.

USE-CASE DIAGRAM:

ACTIVITY DIAGRAM:

(I) CLASS DIAGRAM

The class diagram, also referred to as object modeling is the main static analysis diagram. The main task of object modeling is to graphically show what each object will do in the problem domain. The problem domain describes the structure and the relationships among objects.

Fig.5.CLASS DIAGRAM FOR E-BOOK SYSTEM

INTERACTION DIAGRAM:

A sequence diagram represents the sequence and interactions of a given USE-CASE or scenario. Sequence diagrams can capture most of the information about the system. Most object to object interactions and operations are considered events and events include signals, inputs, decisions, interrupts, transitions and actions to or from users or external devices.

An event also is considered to be any action by an object that sends information. The event line represents a message sent from one object to another, in which the “from” object is requesting an operation be performed by the “to” object. The “to” object performs the operation using a method that the class contains.

It is also represented by the order in which things occur and how the objects in the system send message to one another.

The sequence diagram and collaboration diagram are given below.

Fig.6.1.SEQUENCE DIAGRAM

Fig.6.2.COLLABORATION DIAGRAM

PARTIAL LAYERD LOGICAL ARCHITECTURE DIAGRAM

DEPLOYMENT DIAGRAM AND COMPONENT DIAGRAM

Deployment diagrams are used to visualize the topology of the physical components of a system where the software components are deployed.

COMPONENT DIAGRAM

Component diagrams are used to visualize the organization and relationships among components in a system.

Fig.8.2.COMPONENT DIAGRAM

RESULT:

Thus the mini project for E-Book System has been successfully executed and codes are generated.
