To design a project Foreign Trading System using Rational Rose Software and to implement the software in Visual Basic

PROBLEM STATEMENT

The steps involved in Foreign Trading System are:

The forex system begins its process by getting the username and password from the trader. After the authorization permitted by the administrator, the trader is allowed to perform the sourcing to know about the commodity details. After the required commodities are chosen, the trader places the order. The administrator checks for the availability for the required commodities and updates it in the database. After the commodities are ready for the trade, the trader pays the amount to the administrator. The administrator in turn provides the bill by receiving the amount and updates it in the database. The trader logs out after the confirmation message has been received.

SOFTWARE REQUIREMENT SPECIFICATION

ADMINISTRATOR

One who coordinates the entire trading process.

DATABASE

All the transaction details are stored here.

READER USER

Person who is viewing the website. The traders and the viewers are the users.

SOFTWARE REQUIREMENT SPECIFICATION

This software specification documents full set of features and function for foreign trading system.

FUNCTIONALITY

Transfer purchasing power between countries. Obtain credit for international trade transactions. Minimize exposure to the risks of exchange rate changes.

FUNCTIONALITY REQUIREMENTS

Functional requirements refers to the functionality of the system. The services that are provided to the trader who trades.

UML DIAGRAMS

The exporter submits the relevant documents to his buyer (banker) for getting the payment for the goods exported.

USE CASE DIAGRAM

CLASS DIAGRAM

A class diagram is a type of static structure diagram that describes the structure of a system. The classes in the class diagram represent both the main objects and or interactions in the application. The class diagram is represented using rectangular boxes each of which contains three parts:

SEQUENCE DIAGRAM

A sequence diagram in unified modeling language is a kind of interaction diagram that shows how processes operate with one another and in what order. It is a construct of a Message Sequence Chart. Sequence diagrams are sometimes called event diagrams, event scenarios, and timing diagrams. This diagram shows a parallel vertical lines called lifelines. There are two dimensions in this diagram

1. Vertical dimension-represents time.
2. Horizontal dimension-represent different object

TraderTraderAdministratorAdministratorDatabaseDatabaseLoginSourcingPlace orderUpdateorderPay update account details bill logout

COLLABORATION DIAGRAM

A collaboration diagram belongs to a group of UML diagrams called Interaction Diagrams. collaboration diagrams, like sequence diagrams, show how the objects interact over the course of time. collaboration diagrams show the sequence by numbering the messages on the diagram.

DOCUMENTATION OF COLLABORATION DIAGRAM

The collaboration diagram shows how the trader performs the sourcing and places order for which the administrator provides the bill and updates it in the database.

STATE CHART DIAGRAM

The state chart is used to model dynamic nature of a system. They define different states of an object during its lifetime. And these states are changed by events. So these diagrams are useful for reactive systems i.e., a system that responds to external or internal events. It describes the flow of control from one state to other state. The initial state is represented using the small dot. The final state is represented using a circle surrounded by a small dot

DOCUMENTATION OF STATE CHART DIAGRAM

The state diagram represents the following states.

- The trader logs in the register in the first state and performs sourcing in the second state.
- The trader places the order in the third state.
- The trader receives the bill in the fourth state and pay the required amount in fifth state.
- The trader logouts from the system in the sixth state

ACTIVITY DIAGRAM

This diagram represents the graphical representation of workflows of stepwise activities and actions with support for choice, iteration and concurrency. It shows the overall flow of control.

DOCUMENTATION OF ACTIVITY DIAGRAM

This activity diagram represents the flow of stepwise activities performed in foreign trading system.

- The first action represents the trader logs in to the system.
- The second action is the place where the trader places the order.

- The decision state is the state where the trader decides to place the order.
- If the trader places the order, fill the form for the required commodities.

The next activity is that the administrator provides the bill for those commodities.

- The trader pays for the bill and logout from the system.

COMPONENT DIAGRAM

A component diagram depicts how the components are wired together to form larger components and or software systems. Components are wired together by using an assembly connector to connect the required interface of one component with the provided interface of another component.

DOCUMENTATION OF COMPONENT DIAGRAM

The main component in the component diagram is foreign trading system. The trader who come to do the trading process and administrator who manages all the other processes is the sub components.

DEPLOYMENT DIAGRAM

A deployment diagram models the physical deployment of artifacts on nodes. The nodes appear as boxes, and the artifacts allocated to each node appear as rectangles within the boxes. Nodes may have sub nodes, which appear as nested boxes.

DOCUMENTATION OF DEPLOYMENT DIAGRAM

The processor in this diagram is the foreign trading system. The devices are the trader and administrator who perform the main activities in the system.

PACKAGE DIAGRAM

A package diagram in the unified modeling language depicts the dependencies between the packages that make up a model. It provides a way to group the elements. There are three types of layers in package diagram. They are

- User interface layer
- Domain layer
- Technical services layer

User interface layer

The user interface layer may call upon its directly subordinate application logic layer, and also upon elements of a lower technical service layer, for logging and so forth.

Domain layer

Software objects representing domain concepts (for example, a software class administrator) that fulfill application requirements, such as tracing order and providing the bill.

Technical services layer

General purpose objects and subsystems that provide supporting technical services, such as interfacing with a database or error logging. These services are usually application-independent.

DOCUMENTATION OF PACKAGE DIAGRAM

The three layers in the foreign trading system are

- **User interface layer** – consists of web and login. This layer describes how the trader logs in to the website and trades for the commodities.
- **Domain layer** – shows the activities that are performed inside the trading system. The activities are place order, pay for the bill and logouts.
- **Technical service layer** – The sourcing and updating the details are performed in this layer.

RESULT

Thus the mini project for foreign trading system has been successfully executed and codes are generated.
